removed true in code (looks like some future condition, but not necessary now:

```
return (

/* Table Container */

true && (

)

);

```

Fixed problem with page for particular project: (removed .toString())

added eye in password:

Password

Other issues:

TypeScript instead of js - so many problems could be avoided.

React hook form instead of formik

In many places React.Fragment can be replaced by `<> </>`

In some places magic number can be replace by declared consts

Naming can be better, (I found: data: u)

Strange convention - sometimes anonymous function (components), like this one:
`app/src/components/selectProject.js`

rule to order tailwind properties

on page /user backend filtering can be considered (like in /project)

in activities validation can be added (negative / too large numbers)

in edit project validation should be provided, now, after update it is problem like: empty project is saved, then redirect to /undefined

good practice to avoid important in css: `md:!px-8`
